

ZIMBABWE EZEKIEL GUTI UNIVERSITY

FACULTY OF LAW, BUSINESS INTELLIGENCE AND ECONOMICS

DEPARTMENT OF ECONOMICS, MARKETING AND ENTREPRENEURSHIP

EXAMINATION PAPER

COURSE CODE : MSTM511
COURSE TITLE : QUANTITATIVE MANAGEMENT
DURATION : 3 Hours
DATE : 07 APR 2025

INSTRUCTIONS TO CANDIDATES:

1. No cell phones are allowed in the examination venue.
2. **Section A** is compulsory
3. Answer any **FOUR (3)** questions from **Section B**
4. Begin each question on a new page.
5. The number of marks for each question or part question is shown in brackets []

SECTION A: Case Study

QUESTION 1

The first step in restoring public trust in statistics

Gordon Brown announced this week that he would introduce legislation to make the Office for National Statistics independent. That is no small change. Analogies with the Bank of England are misleading; the last remotely comparable government body to have been given statutory independence was the National Audit Office more than 20 years ago. The ONS is as integral to the weft and weave of government as the NAO ever was, if not more so. The chancellor went further, saying that he would make the governance of official statistics the responsibility of this new, "wholly separate" ONS.

That word "governance" is crucial. While the ONS produces most of the key economic aggregates and a mass of other data, many politically explosive figures come out of Whitehall's big battalions – crime statistics from the Home Office, hospital waiting lists from the health department and so on. Also, the administrations in Scotland, Wales and Northern Ireland increasingly run their own statistical shows. Getting a grip on the governance of all these statistics is needed both for good management and to give the rest of us some reassurance that the whole statistical system is being developed in the public interest, not just on behalf of today's departmental ministers. At present, no one is in overall charge. The chancellor now seems to have reached the welcome view that it is time this was put right. In doing so he will need not only to take a firm hand in Whitehall but also find a way of respecting the independence, and needs, of devolved administrations while ensuring that all parts of the UK co-operate in fields such as health statistics where comparable data are needed.

Somehow, Monday's announcement managed to skirt the uncomfortable topic of trust, referring instead to "entrenching long-term stability". But trust is what this is about. In the government's view, our official statistics are at least as good as anybody else's: it is just that they have become a political football. While the rest of us might have a few quibbles, there is some truth in this. In February, the independent Statistics Commission published a report, *Official Statistics: Perceptions and Trust*. Two conclusions shone through. First, people who use the data – from businessmen to journalists and politicians – already have considerable regard for the ONS's honesty and professionalism. Of course, statistics are complex and things sometimes go wrong. Yet no one doubted the values that underpin the work. But, second, there was huge cynicism about the use and abuse of statistics by government, both among the general public and those closer to policy. Only 17 per cent of the public thought figures were produced without political interference.

Statistics are now the currency of policymaking. This government, in particular, has embraced evidence-based decisions and target setting for public policy, so that progress can be monitored. But, if the currency is debased, then policies will not be rooted in reality. Trust in government, let alone statistics, will be compromised. The commission was set up after political controversies during the previous government over, for example, unemployment statistics. It was something of an experiment, a non-statutory body, reporting to the Treasury and charged with recommending how National Statistics might develop. It has done good work, including

proposals for legislation of the kind to which the chancellor is now committed, and recent reports on *Managing the Quality of Official Statistics* and a statistical assessment of public service agreement (or PSA) targets: things such as hospital waiting lists.

The growth of the target culture puts a premium on data that are real and used sensibly. The commission does not attempt to police political debate. Rather, it tackles concern that, as the use of statistics increases, so too does the scope to mislead rather than inform. In all the excitement about changes to the ONS, the value of this complementary audit and oversight role must not be ignored. Indeed, it needs strengthening. It cannot remain dependent on individuals who come and go and could, therefore, be subject to political appointment. Rather, the commission should become, or be replaced by, a body whose authority and independence, like that of the new ONS, is rooted in statute and guaranteed by its ability to report directly to parliament. The small print of the chancellor's announcement seems to point to such a change. But we must wait on the details and not let the opportunity slip past.

QUESTIONS

- a) Examine the ways in which the government can manipulate national statistics (10 marks)
 - b) Evaluate the significance of establishing an independent Office for National Statistics (20 marks)
 - c) Examine the use of statistics in national development (10 marks)
- (Total 40 marks)**

SECTION B: Answer any (3) questions

Question 2

- a) Making use of examples distinguish between the following:
 - i) Blocks and groups in two-way Anova (4 marks)
 - ii) Parameter and Statistic (4 marks)
 - iii) One way Anova and Two-way Anova (4 marks)
 - iv) Inferential statistics and descriptive statistics (4 marks)
 - v) Dispersion and variability (4 marks)

Total marks [20]

Question 3

Data were collected from ten (10) Zimbabwean Universities pertaining to the number of years in the industry and the total number of programmes studied. Below is the data.

University	1	2	3	4	5	6	7	8	9	10
Years of operation	7	28	18	15	14	15	64	18	25	18
Number of Programmes	30	100	80	60	60	60	150	70	90	85

Using the data above:

- a) Calculate the Spearman's rank correlation coefficient and comment. (8 marks)
- b) Calculate the Kendall Tau's correlation coefficient (8 marks)
- c) Give an overall comment juxtaposing the above computations (4 marks)

Total marks [20]

Question 4

- a) The specific manufacture of a detergent realised an increase in the sales of his commodities. That propelled him to do a study in order to examine the variables related to the surge in sales. Consequently, data were collected and tabulated into mutually exclusive categories as follows:

		<i>Customer attitude</i>	
		Positive	Negative
<i>Repeat patronage</i>	High	36	15
	Low	19	10

- a) Test at 5% level of significance if there is an association between customer attitudes and their repeat patronage behaviour and comment on the genuineness of the loyalty to the brand. (15 marks)
- b) Give overall implications of the underpinning relationships and suggest the way forward. (5 marks)

Total marks [20]

Question 5

An employer hired several employees with different levels of academic qualifications. The operations manager complained about the position highlighting that employee performance is associated with the level of academic qualifications obtained. The employer collected and tabulated the following data during the probation period of the employees.

		<i>Geographical Locations</i>		
		Ordinary Level	Diploma	Bachelor's degree
<i>Working Speed</i>	Slow	13	7	4
	Fast	3	14	19

- a) Test at 5% the assertion made by the operations manager (15 marks)
- b) Prepare key points to discuss with the operations manager on the way forward. (5 marks)

Total marks [20]

.....**END OF THE EXAMINATION**.....

ZIMBABWE EZEKIEL GUTI UNIVERSITY
FACULTY OF LAW, BUSINESS INTELLIGENCE AND ECONOMICS

STATISTICAL FORMULAE

Sample Variance: $s^2 = \frac{\sum(x-\bar{x})^2}{n-1}$

Sample Standard Deviation: $s = \sqrt{\frac{\sum(x-\bar{x})^2}{n-1}}$

Product moment correlation coefficient:

$$r_{xy} = \frac{n \sum xy - \sum x \sum y}{\sqrt{[n \sum x^2 - (\sum x)^2][n \sum y^2 - (\sum y)^2]}}$$

Spearman's rank order correlation coefficient: $r_{ho} = 1 - \frac{6 \sum d^2}{n(n^2-1)}$

Kendall Tau's correlation coefficient $r_k = \frac{C-D}{C+D}$ or $r_k = \frac{S}{\frac{n(n-1)}{2}}$

Chi-squared Test Statistic: $\chi^2 = \sum \frac{(O-E)^2}{E}$

Z-score: $Z = \frac{x-\bar{x}}{s}$

Standardisation: $Z = \frac{x-\mu}{\sigma}$ Where $Z \sim N(0,1)$

T-score: $T = 50 + 10\left(\frac{x-\bar{x}}{s}\right)$

Student t-test: $t = \frac{\sqrt{(n-1)} \cdot \sum d}{\sqrt{n \sum d^2 - (\sum d)^2}}$

Total Sum of Squares $TSS = \sum x_{ij}^2 - \frac{G^2}{N}$

Group Sum of Squares $GSS = \sum \frac{T^2}{n} - \frac{G^2}{N}$

Block Sum of Squares $BSS = \sum \frac{B^2}{b} - \frac{G^2}{N}$

Residual Sum of Squares: One-way $RSS = TSS - GSS$

Residual Sum of Squares: Two-way $RSS = TSS - (GSS + BSS)$

Area under the Normal Curve $P(Z \leq z)$ From -3.49 to 3.62
